

Wind Power Explained

How moving air becomes useful renewable electricity

1

Wind turns the blades

Moving air pushes the turbine blades and begins the rotation.

2

A shaft transfers motion

The rotating hub turns a shaft inside the nacelle at the top.

3

A generator makes electricity

The generator changes mechanical energy into electrical energy.

4

Power travels to the grid

Cables and transformers prepare the electricity for homes and businesses.

Renewable does not mean impact-free: careful placement protects people and wildlife.
